

# call Everywhere

Who wants to **REDUCE** their local and long distance costs – while using their **EXISTING** phone system?

SIP Trunking

With SIP Trunking, you can leverage your investment in a PBX or Key System and use cost efficient IP technology to lower your monthly telco costs. Save as much as 65 %!

- Nationwide coverage – one provider across the country
- Free calling between all users on the service
- Available upgrades include electronic faxing and IVR

## Features

**Local dial tone, E911, directory listing, caller id with name – all easily integrate with your existing phone system.**

**Local and LD Calling:** Choose a plan to fit your requirements. Make and receive calls just as you do today.

**E911:** Emergency calls are immediately sent along with your registered physical address to an Electronically bonded Public Safety Answering Point

**Directory Listing:** Have your business listed in the local business white pages and retain the option to advertise in the yellow pages

## How Does SIP Trunking Work?

An Internet Access Device (IAD) is installed in your office, allowing your existing analog or digital phone system to be connected to the IP based callEverywhere service. There is no need to replace any of your phones or change your phone numbers. Your phones stay connected to your existing phone system, as they are today.

During the professional installation, the old outside phone lines are disconnected from your phone system and then the system is connected to the new IAD. The IAD is connected to your data router and will route your voice traffic to Intelliverse over your secure private New Edge Network. Your phone system will continue to support station to station calling, voicemail, and hunt groups/rollovers.

## The Critical Difference

### How does the integrated Intelliverse and New Edge product offering benefit you?

By providing you with a reliable, business-class Voice service from Intelliverse along with a nationwide, secure, private MPLS network from New Edge.

## Devices

### Analog/Digital Gateways

- ATAs allow you to turn fax and credit card machines into IP-enabled communication end points.
- Gateways allow existing PBX or Key Systems to be connected to an IP based Voice Service.
- Analog gateways support 4-24 FXS channels
- Digital gateways support PR1/T1 spans
